(54) MASS-PRODUCTION OF TAXOL BY SEMI-CONTINUOUS CULTIVATION

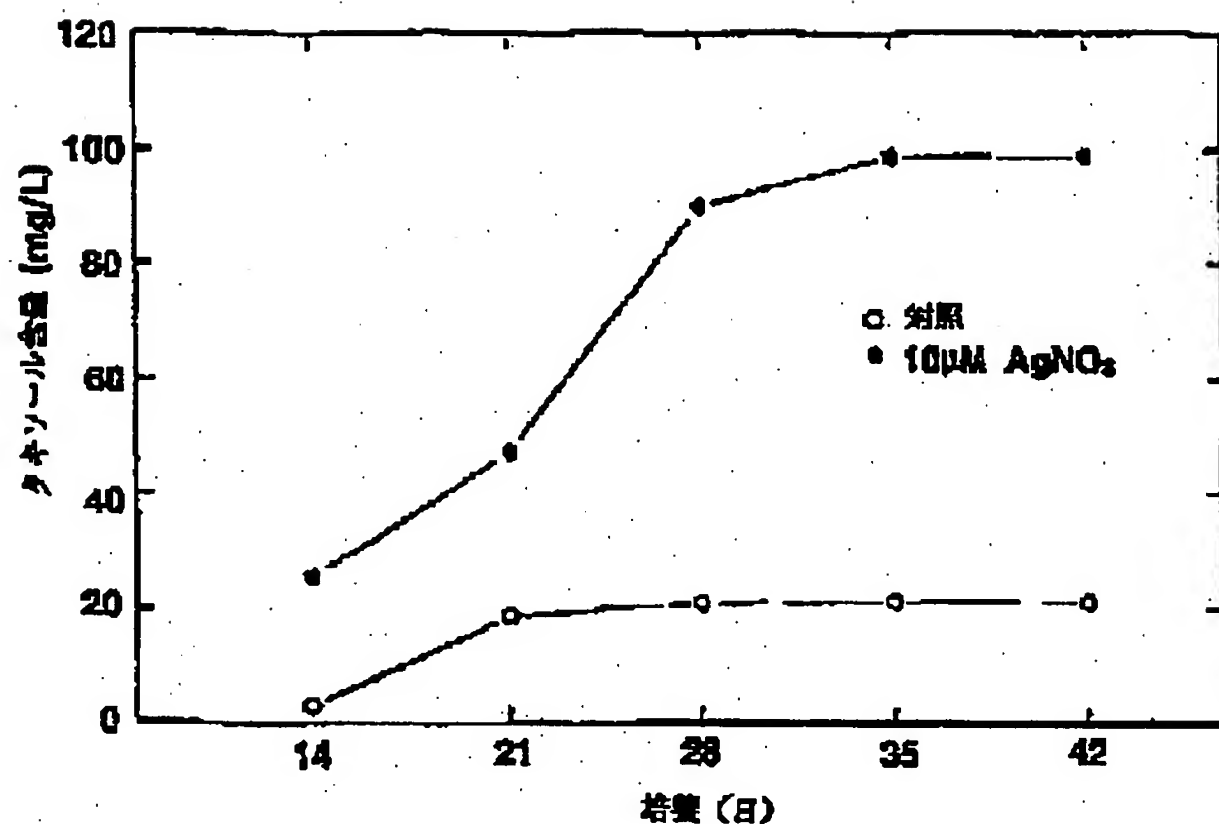

(57) Abstract:

PROBLEM TO BE SOLVED: To mass-produce taxol useful for treatment or the like of leukemia, ovarian cancer, breast cancer, lung cancer or the like by culturing plant cells derived from a plant belonging to the genus *Taxus* in a medium containing a specific amount of silver nitrate, and gathering the product.

SOLUTION: A tissue derived from the bark, leaves, trunks or roots of a plant belonging to the genus *Taxus* (e.g. *Taxus chinensis*) is washed with tap water, sterilized with a sodium hypochlorite solution, washed with distilled water, and cut into 1 cm length. The cut tissue is transferred to a solid medium containing naphthoxyacetic acid, 6-benzylaminopurine or the like and

Incubated under the condition of 24-26°C for 2-6 weeks to induce calluses. The obtained calluses are cultured in a growth medium to provide an SYG-1 cell line, and the obtained cell line is cultivated in a medium containing 1-15 μM AgNO_3 . The taxol is collected from the cultured product to mass-produce the objective taxol in high yield. The obtained taxol is useful for treatment or the like of leukemia, ovarian cancer, breast cancer, lung cancer or the like.
